

BIRNS XT120 UNDERWATER LIGHT

The Birns XT120 is the perfect light for either 120 or 240 volt ROV's. Simply stated, it gives you *more light for less money.*

The XT120 cuts operating costs. Its low weight and hydrodynamic design reduce drag. Its solderless connections eliminate maintenance, and its 30-second relamping time (from either front or rear, *without removal from the vehicle*) decreases servicing.

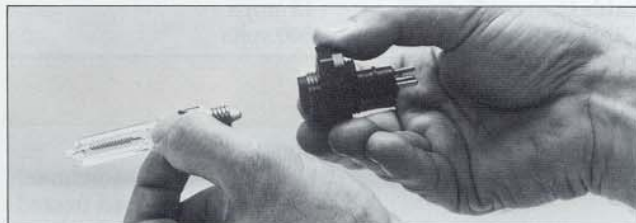

The XT120 gives you more light. With a frosted lens the XT120 produces a uniform 74° beam without 'hot-spots', *twice** that of open-reflector luminaires using the same lamp. The XT120 with a clear lens installed produces *three times** the open-reflector output. The XT120's aluminised parabolic internal reflector will never discolour, and dirty water will never decrease its efficiency.

And yet the XT120 is safe.

The XT120 housing is earthed. It is dielectric to 500 volts, and due to its design and all-metal construction will withstand hard knocks and blows without breaking or flooding.

You can buy a *cheaper* light than the XT120, but you *cannot* buy a more *cost-effective* light.

For underwater lights that make all others obsolete, come to the Lighting Experts. **Birns.**

30 second tool-free relamping
